REMOVING DATA FROM CONTIGUOUS DATA FLOWS

Abstract of the Disclosure

A contiguous data stream may have a data element
removed to produce a contiguous, uninterrupted output data

5   stream. This may be done by controlling a series of
buffers, each of whose size corresponds to the element to
be removed. For example, the element to be removed may not
be written into a buffer and therefore is effectively lost.
Alternatively, the element to be removed may be written

10   into a buffer and thereafter overwritten with data that is
not to be removed.
